Diagnostic Function Tests in Chemical Pathology P.T. Lascelles, D. Donaldson, 1990-03-31 This book is written for hospital doctors nurses biochemists medical laboratory scientific officers and phlebotomists involved with the biochemical investigation of patients It is hoped also that general practitioners and medical students will find it of help Whilst the vast majority of biochemical tests assess the level of constituents in blood and urine at a given point in time an important additional parameter is the assessment of physiological reserve function by means of loading tests prolonged fasting exercise and clearance studies The protocol and interpretation of response of each of these stress tests form the main basis of the text An attempt has been made to be reasonably comprehensive in the range of tests described hence not only have some rather older ones been retained but also some very recently introduced ones included It is appreciated that practice varies widely from laboratory to laboratory with respect to protocol sample collection methodology and quotation of reference ranges and no doubt also from clinician to clinician particularly regarding interpretation of results In paediatric work micromethods will demand much smaller volumes of blood than those stated here which relate generally to adult medicine The account therefore must be seen as a guide to practice rather than as a recipe it is in no way an attempt to standardise procedures which depend on the local requirements

Regulation of Gastrointestinal Mucosal Growth Rao N. Jaladanki, Jian-Ying Wang, 2016-11-30 The mammalian gastrointestinal mucosa is a rapidly self renewing tissue in the body and its homeostasis is preserved through the strict regulation of epithelial cell proliferation growth arrest and apoptosis The control of the growth of gastrointestinal mucosa is unique and compared with most other tissue in the body complex Mucosal growth is regulated by the same hormones that alter metabolism in other tissues but the gastrointestinal mucosa also responds to host events triggered by the ingestion and presence of food within the digestive tract These gut hormones and peptides regulate the growth of the exocrine pancreas gallbladder epithelium and the mucosa of the oxyntic gland region of the stomach and the small and large intestines Luminal factors including nutrients or other dietary factors secretions and microbes that occur within the lumen and distribute over a proximal to distal gradient are also crucial for maintenance of normal gut mucosal regeneration and could explain the villous height crypt depth gradient and variety of adaptation since these factors are diluted absorbed and destroyed as they pass down the digestive tract Recently intestinal stem cells cellular polyamines and noncoding RNAs are shown to play an important role in the regulation of gastrointestinal mucosal growth under physiological and various pathological conditions In this book we highlight key issues and factors that control gastrointestinal mucosal growth and homeostasis with special emphasis on the mechanisms through which epithelial renewal and apoptosis are regulated at the cellular and molecular levels
